

In this note we catalog the subalgebra structure for the finite cluster algebras  $\subseteq E_6$ .

These algebras are:  $A_2, A_3, A_4, D_4, A_5, D_5, E_6$ .

$A_2$     clusters: 5       $a$ -coordinates: 5       $x$ -coordinates: 10

$A_3$     clusters: 14       $a$ -coordinates: 9       $x$ -coordinates: 30

Type	Sub-polytopes	Distinct Subalgebras
$A_2$	6	6
$A_1 \times A_1$	3	3

$A_4$     clusters: 42       $a$ -coordinates: 14       $x$ -coordinates: 70

Type	Sub-polytopes	Distinct Subalgebras
$A_2$	28	21
$A_1 \times A_1$	28	28
$A_3$	7	7
$A_2 \times A_1$	7	7
$A_1 \times A_1 \times A_1$	0	0

$D_4$     clusters: 50       $a$ -coordinates: 16       $x$ -coordinates: 104

## How to count co-dimension 1 & 2 subalgebras

This algorithm comes from Hugh Thomas.

Our goal is to count the number of cluster algebras of type  $Y$  of rank  $n - 1$  in a finite type cluster algebra of type  $X$  of rank  $n$ .

Let  $N$  be the number of cluster  $a$ -coordinates in the cluster algebra of type  $X$ .

Let  $n$  be the rank of cluster algebra of type  $X$ .

Let  $Z$  be the number of ways to remove a node from a Dynkin diagram of type  $X$  to obtain one of type  $Y$ .

The number of cluster algebras of type  $Y$  is then  $NZ/n$ .

As an example, let's count the number of  $A_4$ 's in  $A_5$ :

$N = \#$  of cluster  $a$ -coordinates in  $A_5 = 20$

$n = \text{rank of } A_5 = 5$

$Z = \#$  of ways to remove a node from  $A_5$  and get an  $A_4 = 2$

$20 \times 2/5 = 8 \Rightarrow$  there are 8  $A_4$ 's in  $A_5$ .
